

- Following vector: $x_i = (0, 1, 1, 0, \dots, 1)^\top$,
where $x_{ik} = \mathbb{1}\{\text{nominee } i \text{ follows account } k\}$
- Similarity: $S(i, j) = \frac{x_i^\top x_j}{||x_i|| \cdot ||x_j||} = \text{cosine of angle between vectors}$
- Conclusion: co-workers, friends, related accounts tend to have high similarity
